

## **AMENDMENTS TO THE CLAIMS**

### **In the Claims:**

The following listing of claims replaces all prior versions and listings of claims in the application.

### **Listing of Claims:**

1. (Currently Amended) A method for controlling production and exportation, used to connect trading branches of an enterprise to a system for controlling production and exportation via a network, wherein the system for controlling production and exportation shares client orders with the trading branches for product exportation, so as to improve business performances for the trading branches, and enhance profits for the enterprise; the method comprising the steps of:

(1) receiving client order data transmitted from a ~~first~~ receiving trading branch via the system for controlling production and exportation, and storing the client order data in an original database of the system for controlling production and exportation, wherein the ~~first~~ receiving trading branch does not perform production and exportation;

(2) retrieving the client order data from the original database via the system for controlling production and exportation, and processing the client order data to be first processed order data in a manner that, a material lacking status of the ~~first~~ receiving trading branch is marked in the client order data, a seller is changed from the ~~first~~ receiving trading branch to a ~~second~~ controlling trading branch, and product prices are adjusted to be lower, wherein the first processed order data are stored in a first database; prompting the ~~second~~ controlling trading branch to login the system for controlling production and exportation, and retrieving the first processed order data from the first database according to system authorization provided for the ~~second~~ controlling trading branch via the system for controlling production and exportation, so as to assign the first processed order data to the ~~second~~ controlling trading branch as a business performance thereof, whereas the ~~second~~ controlling trading branch does not perform production and exportation;

(3) determining that an exporting trading branch has better resources for product manufacturing and exportation based on the first processed order data by the controlling

~~trading branch~~ retrieving the first processed order data from the first database via the system for controlling production and exportation, and processing the first processed order data to second processed order data in a manner that, a material lacking status of the ~~second~~ controlling trading branch is marked in the first processed order data, a seller is changed from the ~~second~~ controlling trading branch to a ~~third~~ the exporting trading branch, and the product prices are adjusted to be further lower, wherein the second processed order data are stored in a second database; prompting the ~~third~~ exporting trading branch to login the system for controlling production and exportation, and retrieving the second processed order data from the second database according to system authorization provided for the ~~third~~ exporting trading branch via the system for controlling production and exportation, so as to assign the second processed order data to the ~~third~~ exporting trading branch as a business performance thereof, and allow the ~~third~~ exporting trading branch to perform product manufacture; and

(4) exporting manufactured products to the ~~first~~ receiving trading branch via the ~~third~~ exporting trading branch after completing the product manufacture.

2. (Currently Amended) The method of claim 1, wherein the step (2) further comprises: (2-1) determining via the system for controlling production and exportation if a request for transferring a client order is submitted by the ~~second~~ controlling trading branch, wherein if the request is submitted, the step (3) is followed; or else, the step (2-1) is repeated.

3. (Currently Amended) The method of claim 1, wherein the step (4) further comprises: login the system for controlling production and exportation via the ~~first~~ receiving trading branch after receiving the manufactured products from the ~~third~~ exporting trading branch, and retrieving the client order data from the original database via the system for controlling production and exportation according to system authorization provided for the ~~first~~ receiving trading branch, so as to allow the ~~first~~ receiving trading branch to determine if the manufactured products are complete according to the client order data.

4-5. (Canceled).

6. (Currently Amended) The method of claim ~~[[5]]~~ 1, wherein the resources include human resources.

7. (Previously Presented) The method of claim 1, wherein the network is internet or intranet.

8. (Previously Presented) The method of claim 1, wherein the system for controlling production and exportation is established in a server host.

9. (Currently Amended) A system for controlling production and exportation, connected with trading branches of an enterprise via a network, allowing client orders to be shared with the trading branches for product exportation, so as to improve business performances for the trading branches, and enhance profits for the enterprise; the system comprising:

an original database for storing client order data received by a ~~first~~ receiving trading branch;

an analyzing module for generating corresponding reaction according to requests transmitted from the trading branches;

a processing module for transferring the client order data from the ~~first~~ receiving trading branch to other trading branches,

wherein upon receiving a request for uploading the client order data from the ~~first~~ receiving trading branch, the analyzing module stores the uploaded client order data in the original database according to system authorization provided for the ~~first~~ receiving trading branch, and prompts the processing module to retrieve the client order data from the original database, so as to process the client order data to be first processed order data in a manner that, order items of the client order data are reset to be in a material lacking status, product prices are adjusted to be lower than those in the client order data, and a seller is changed from the ~~first~~ receiving trading branch to a ~~second~~ controlling trading branch;

wherein subsequently the controlling trading branch determines that an exportation trading branch has better resources for product manufacturing and exportation based on the first processed order data, then the processing module processes the first processed order data to be second processed order data in a manner that, order items of the first processed order data are reset to be in a material lacking status, product prices are adjusted to be lower than those in the first processed order data, and a seller is changed from the ~~second~~ controlling trading branch to a ~~third~~ exporting trading branch, so as to allow the ~~third~~ exporting trading branch to perform product manufacture and export manufactured products to the ~~first~~ receiving

trading branch; a first database for storing the first processed order data to be retrieved by the ~~second~~ controlling trading branch after login the system for controlling production and exportation; and a second database for storing the second processed order data to be retrieved by the ~~third~~ exporting trading branch after login the system for controlling production and exportation.

10. (Currently Amended) The system of claim 9, wherein after receiving the manufactured products from the ~~third~~ exporting trading branch, the ~~first~~ receiving trading branch logs the system for controlling production and exportation, and the analyzing module is prompted to retrieve the client order data from the original database according to system authorization provided for the ~~first~~ receiving trading branch, so as to allow the ~~first~~ receiving trading branch to determine if the manufactured products are complete according to the client order data.

11–12. (Canceled).

13. (Currently Amended) The system of claim ~~[[12]]~~ 9, wherein the resources include human resources.

14. (Previously Presented) The system of claim 9, wherein the network is internet or intranet.

15. (Previously Presented) The system of claim 9, wherein the system for controlling production and exportation is established in a server host.
